ServiceNow-Based Employee Laptop Request Application

**Record Producer, Service Portal & Flow Designer
Integration**

**A ServiceNow Application for Centralized
Employee Laptop Request Submission and
Approval**

Submitted by

JAJULA NAGAMANI

September 2026

ServiceNow-Based Employee Laptop Request Application

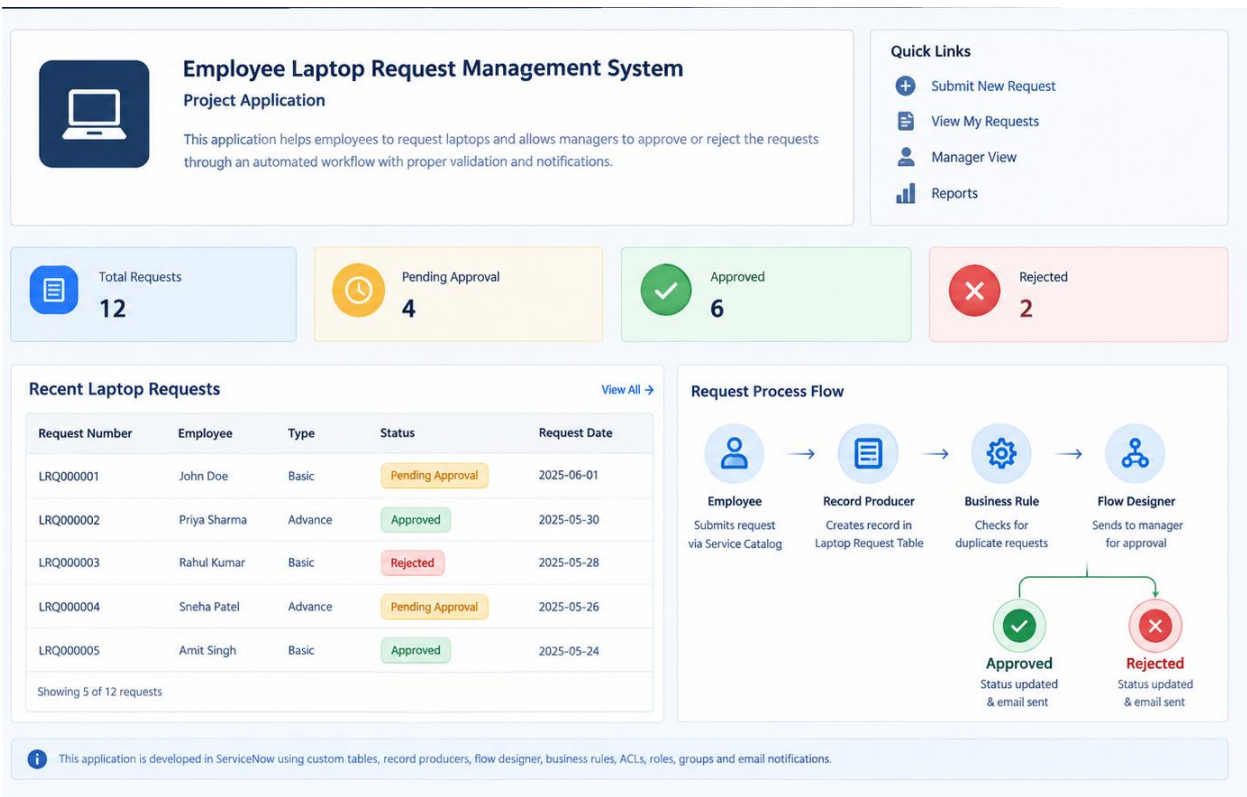

1. INTRODUCTION

1.1 Background

In an organization, employees may need laptops for software development, personal work, or other business activities. Managing these requests manually through emails or verbal communication can cause delays, duplicate requests, and difficulty in tracking approvals.

To overcome these issues, the **Employee Laptop Request Management System** was developed using ServiceNow. The system provides a centralized platform where employees can submit laptop requests and managers can approve or reject them.

The system also provides automated validation, approval workflow, email notifications, role-based access, and request tracking.

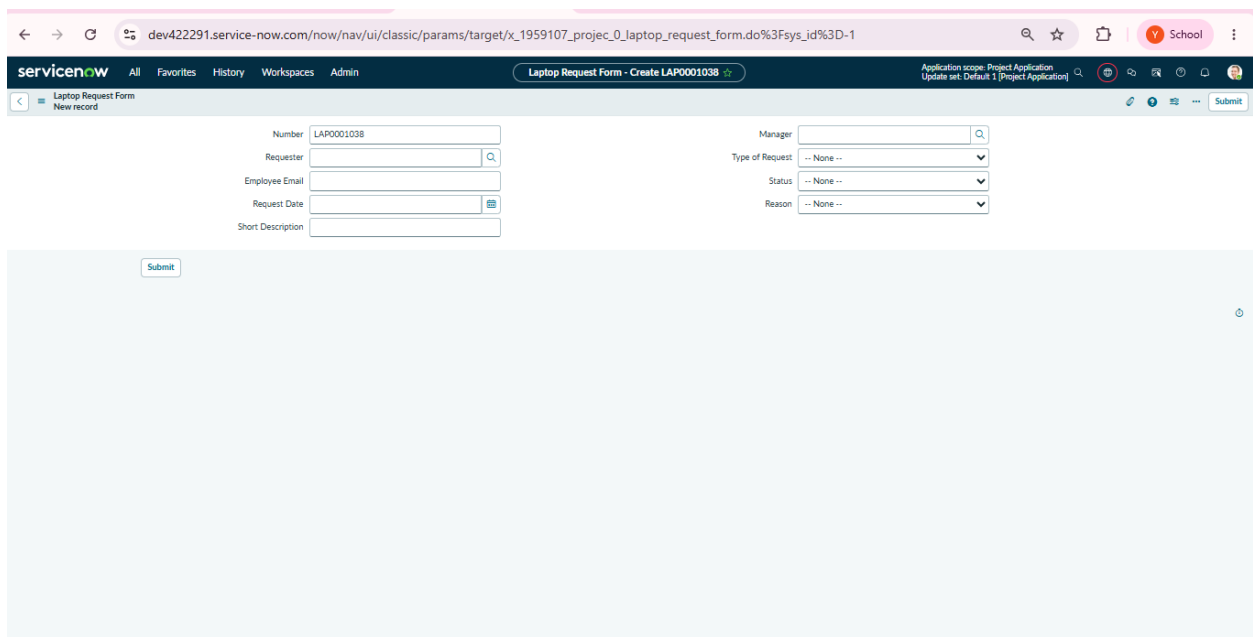

1.2 Problem Statement

The existing laptop request process depends mainly on manual communication such as emails and verbal requests. This can result in:

- Delayed approvals
- Duplicate requests
- Difficulty tracking requests
- Lack of centralized information
- Manual follow-up with managers
- Limited visibility for IT teams

Therefore, an automated and secure laptop request management system is required.

The screenshot shows a web browser window displaying a ServiceNow form titled 'Laptop Request Form - Create LAP0001038'. The browser's address bar shows the URL: dev422291.service-now.com/now/nav/ui/classic/params/target/x_1959107_projec_0_laptop_request_form.do%3Fsys_id%3D-1. The ServiceNow header includes navigation links like 'All', 'Favorites', 'History', 'Workspaces', and 'Admin'. The form itself has a left sidebar with a 'Laptop Request Form' icon and a 'New record' button. The main form area contains several input fields: 'Number' (pre-filled with LAP0001038), 'Requester' (with a search icon), 'Employee Email', 'Request Date' (with a calendar icon), and 'Short Description'. On the right side, there are dropdown menus for 'Manager', 'Type of Request' (set to '-- None --'), 'Status' (set to '-- None --'), and 'Reason' (set to '-- None --'). A 'Submit' button is located at the bottom left of the form area.

1.3 Proposed Solution

The proposed solution is a ServiceNow-based application that allows employees to submit laptop requests through a **Record Producer** in the Employee Service Catalog.

The system automatically:

1. Validates the request.
2. Checks for duplicate requests.
3. Creates the laptop request record.

4. Sets the request to **Pending Approval**.
5. Sends the request to the employee's manager.
6. Allows the manager to approve or reject it.
7. Updates the request status.
8. Sends email notifications to the requester.
9. Provides secure access using roles, groups, and ACLs.

2. PROJECT OBJECTIVES

The main objectives of the project are:

- To provide a centralized laptop request system.
- To allow employees to submit requests easily.
- To classify requests as **Basic** or **Advance**.
- To prevent duplicate requests within the same year.
- To automate manager approval.
- To maintain request status and tracking.
- To send automatic email notifications.
- To provide role-based security.
- To reduce manual communication and follow-up.
- To improve transparency and accountability.

3. KEY FEATURES

Feature	Description
Laptop Request	Employees can submit laptop requests.
Basic/Advance Request	Employees can select the required request type.
Request Reason	Employees can provide the purpose of the request.
Duplicate Prevention	Prevents multiple requests from the same employee within a year.
Manager Approval	Manager can approve or reject requests.
Status Tracking	Request status changes automatically.
Email Notifications	Requester and manager receive notifications.
Role-Based Access	Employees and managers have different permissions.
ACL Security	Controls access to records and operations.
Service Catalog	Provides a user-friendly request submission interface.
Update Set	Allows application configuration to be moved between instances.

The screenshot displays the 'Laptop Request' form within the ServiceNow application. The browser's address bar shows the URL: `dev422291.service-now.com/sp?id=sc_cat_item&sys_id=07f1d5723b87c3502a6326e0c5e45a8b`. The ServiceNow header includes navigation links for Knowledge, Catalog, Requests, System Status, Cart, Tours, and the user profile (System Administrator). The breadcrumb trail indicates the path: Home > All Catalogs > Employee Service Catalog > Service > Laptop Request. A search bar is located above the form. The form itself is titled 'Laptop Request' and contains several sections: 'Type of laptop' with radio buttons for 'None' (selected), 'Advance', and 'Basic'; 'Employee mail id' with a text input field and a magnifying glass icon; 'What is Employee name?' with a dropdown menu; 'Short description' with a text area; 'Status' with radio buttons for 'None' (selected), 'Approved', 'Pending Approval', 'Rejected', and 'Requested'; 'When did you want' with a date-time picker showing 'YYYY-MM-DD HH:mm:ss'; and 'Reason' with radio buttons for 'None' (selected), 'Other', and 'Software Development'. To the right of the form is a floating sidebar with a 'Save as Draft' button and a 'Submit' button. A chat icon is visible in the bottom right corner of the interface.

4. SERVICENOW DEVELOPER SETUP

4.1 ServiceNow Developer Access

ServiceNow provides a cloud-based development environment for building and testing applications.

The ServiceNow Developer platform was used to create the Employee Laptop Request Management System.

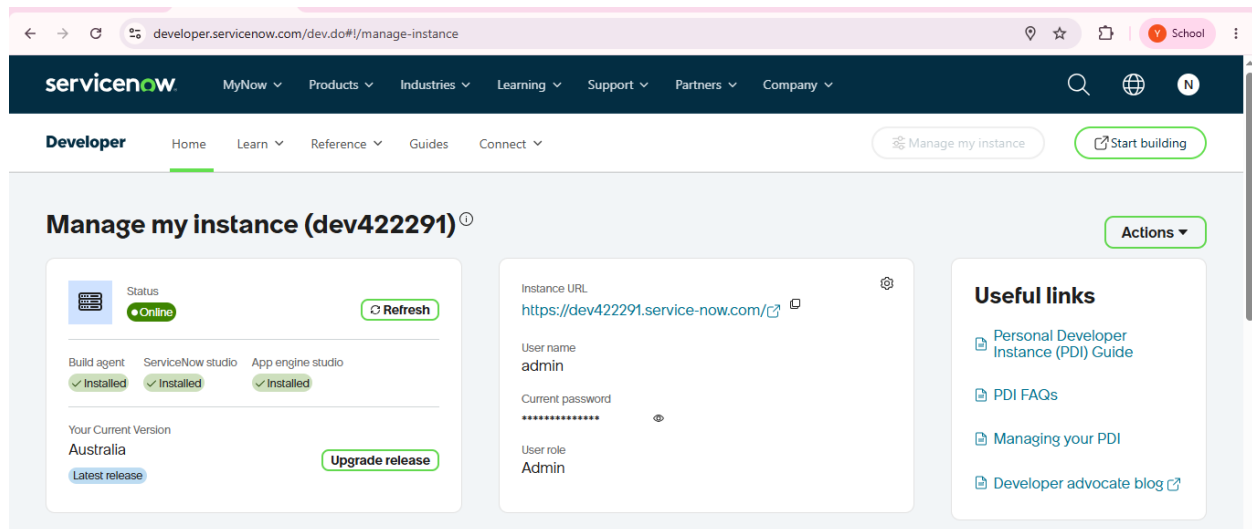

The development environment provides access to:

- Application development
- Tables
- Forms
- Record Producers
- Flow Designer
- Business Rules
- ACLs
- Roles
- Groups
- Notifications
- Update Sets

4.2 Personal Developer Instance

A Personal Developer Instance (PDI) was used to develop and test the application.

The PDI provides an isolated ServiceNow environment where the application configurations can be created and tested safely.

4.3 Development Environment

The project was developed using the following ServiceNow components:

Component	Used For
ServiceNow Studio	Application development
Project Application	Custom application
Laptop Request Form	Main custom table
Record Producer	Employee request submission
Flow Designer	Approval automation
Business Rule	Duplicate validation
Roles	Access management
Groups	User classification
ACLs	Record security
Email Notifications	Request communication
Update Set	Deployment

5. PROJECT IMPLEMENTATION IN SERVICENOW

5.1 Custom Application Creation

A custom scoped application named **Project Application** was created using ServiceNow Studio.

The application contains all the required components for managing employee laptop requests.

The application was developed inside the **HR Onboarding Application Update Set** so that the configurations could be captured and moved to another instance.

Application Name

Project Application

Update Set

HR Onboarding Application

The screenshot displays the ServiceNow Studio interface for configuring an application. The browser address bar shows the URL: `dev422291.service-now.com/now/nav/ui/classic/params/target/sys_update_set.do%3Fsys_id%3D4120d8f63b4f83502a6326e0c5e45a7e%26sysparm_re...`. The ServiceNow logo and navigation tabs (All, Favorites, History, Workspaces, Admin) are visible at the top. The main header indicates the current context: "Update Set - HR onboarding application".

The configuration form includes the following fields:

- Name:** HR onboarding application
- State:** Complete
- Parent:** (Searchable field)
- Release date:** 2025-09-04 23:35:41
- Install date:** (Empty field)
- Installed from:** (Empty field)
- Application:** Global
- Created:** 2025-09-03 23:36:50
- Created by:** admin
- Merged to:** (Empty field)

The **Description** field contains the text: "This is an HR Onboarding Application Update Set".

At the bottom of the form, there are buttons for "Update" and "Back Out". Below these buttons, a section titled "Related Links" provides additional resources:

- [Export Update Set Batch to XML](#)
- [Scan Update Set](#)
- [Scan Update Set Batch](#)
- [\[SN Utils\] Versions \[Q\]](#)

5.2 Laptop Request Form Table

A custom table named **Laptop Request Form** was created to store employee laptop request information.

The table contains the following fields:

Field	Type	Purpose
Number	Auto Number	Unique request number
Requester	Reference	Employee who submits request
Employee Email	Email	Employee email address
Request Date	Date/Time	Request submission date
Short Description	String	Brief request description
Manager	Reference	Employee's manager
Type of Request	Choice	Basic or Advance
Status	Choice	Pending Approval, Approved, Rejected
Reason	Choice	Purpose of laptop request

The table acts as the main database for the application.

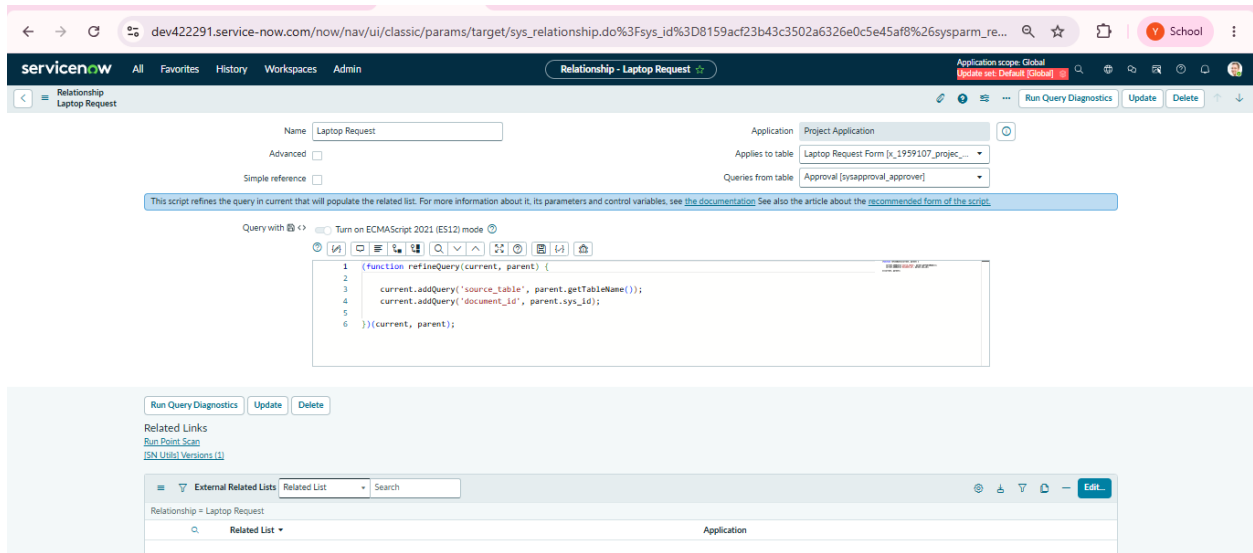

5.3 Approval Table Relationship

A relationship was created between the **Laptop Request Form** table and the ServiceNow **Approval** table.

This relationship allows approval records associated with a laptop request to be viewed from the request record.

The approval information helps track:

- Who approved the request
- Approval status
- Approval activity
- Request approval history

5.4 Laptop Request Record Producer

A Record Producer named **Laptop Request** was created.

The Record Producer provides a simple interface for employees to submit their laptop requests through the Service Catalog.

Record Producer

Name: Laptop Request

Target Table: Laptop Request Form

When the employee submits the form, ServiceNow creates a record in the Laptop Request Form table.

Build and modify items faster with the improved **Catalog Builder**.

Name: Laptop Request Application: Project Application

* Table name: Laptop Request Form [x_1959107_projec... Active: ☒

State: -- None --

Checked out: -- None --

Short description

Description

Meta

Generated task record

Redirect to

Configure a script to accomplish tasks such as:

- Redirecting the user to another page after the record producer is submitted
- Displaying an info message at the top of the page the user is redirected to after the record producer is submitted
- Dynamically assigning values to specific fields on the generated record

Script

Turn on ECMAScript 2021 (ES12) mode

```

1 /** This script is executed before the Record is generated
2 * 'current' - GlideRecord produced by Record Producer
3 * Don't use 'current.update()' or 'current.insert()' as the record is generated by Record Producer
4 * Don't use 'current.setValue('sys_class_name', 'xxx')' as this will trigger reparent flow and can cause
   data loss
5 * Avoid 'current.setAbortAction()' and generate a separate record
6 * Use 'producer.var1' to access variables
7 */

```

Run Point Scan

SN Utiliti Versions (41)

5.5 Record Producer Variables

Variables were created in the Record Producer to collect the required information from employees.

The variables are mapped to the corresponding fields in the Laptop Request Form table.

Variable	Purpose
Requester	Identifies the employee
Employee Email	Captures employee email
Request Date	Captures request date

Short	Captures request
Description	details
Manager	Identifies manager
Type of Request	Basic/Advance
Reason	Request purpose

The variables are mapped to the table fields using the appropriate question/field mappings.

The screenshot shows the ServiceNow Record Producer interface for a 'Laptop Request' record. The top navigation bar includes 'servicenow', 'All', 'Favorites', 'History', 'Workspaces', and 'Admin'. The main header displays 'Record Producer - Laptop Request' with a search icon and a 'New' button. Below the header, there is a code editor with a JavaScript snippet:

```
5 * Avoid 'current.setAbortAction()' and generate a separate record
6 * Use 'producer.var1' to access variables
7 */
```

Below the code editor, there are sections for 'Images (desktop view)' and 'Icon'. The 'Related Links' section includes links for 'Item Diagnostic', 'Show VA render type', 'Run Point Scan', and 'SN UHIO Versions (41)'. The 'Variables' section shows a table with 7 variables, 1 variable set, 1 catalog UI policy, 1 catalog client script, 1 available for, 1 not available for, 1 category, 1 catalog, 1 catalog data lookup definition, 1 related article, 1 related catalog item, and 1 assigned topic. The 'Catalog Item' section shows a table with 7 questions and 7 fields.

Question	Field	Type	Order
Type of laptop	type_of_request	Multiple Choice	
Employee mail Id	employee_email	Email	
What is Employee name?	requester	Reference	
Short description	short_description	Multi Line Text	
Status	status	Multiple Choice	
When did you want	request_date	Date/Time	
Reason	reason	Multiple Choice	

5.6 Employee Service Catalog Configuration

The Record Producer was added to the **Employee Service Catalog**.

This allows employees to access the laptop request form from the Service Portal/Employee Center.

The catalog provides a user-friendly interface for submitting requests.

Catalog Configuration

Catalog: Employee Service Catalog

Category: Service

Item: Laptop Request

The screenshot shows the ServiceNow 'Laptop Request' form. The form is titled 'Laptop Request' and is located under the 'Employee Service Catalog' > 'Service' > 'Laptop Request' path. The form includes the following fields:

- Type of laptop:** Radio buttons for None (selected), Advanced, and Basic.
- Employee mail id:** A text input field with a search icon.
- What is Employee name?:** A dropdown menu.
- Short description:** A text input field.
- Status:** Radio buttons for None (selected), Approved, Pending Approval, Rejected, and Requested.
- When did you want:** A date and time input field with a calendar icon.
- Reason:** Radio buttons for None (selected), Other, and Software Development.

On the right side of the form, there is a 'Save as Draft' button and a 'Submit' button.

5.7 Flow Designer Approval Workflow

Flow Designer was used to automate the laptop request approval process.

Trigger

The flow starts when a new record is created in the **Laptop Request Form** table.

Flow Process

Record Created → Pending Approval → Manager Approval → Approved/Rejected → Email Notification

Step 1 – Update Record

When a request is created, the status is automatically changed to:

Pending Approval

Step 2 – Ask for Approval

The **Ask for Approval** action is used.

The approval is assigned to the employee's **Manager**.

The record to approve is the **Laptop Request Form Record** from the Trigger data pill.

The flow waits until the manager approves or rejects the request.

The screenshot displays the ServiceNow Workflow Studio interface for the 'Employee Laptop Request Approval Flow'. The flow is currently active and is shown in a diagrammatic view. The trigger is 'Laptop Request Form Created'. The actions are: 1. Update Laptop Request Form Record, 2. Ask For Approval on Laptop Request Form, 3. If If Approved (decision), 4. Update Laptop Request Form Record (then), 5. Send Email (then), 6. Else, 7. Update Laptop Request Form Record (else), 8. Send Email (else). The flow is shown in a diagrammatic view with a 'Data' panel on the right showing the data structure for each step. Below the flow diagram, the 'EXECUTION DETAILS' section shows the flow's execution history. The flow was run by 'System Administrator' on 2026-09-06 22:29:36 and completed successfully. The execution details table is as follows:

Step	Action	State	Start time	Duration
1	Update Record	Completed	2026-09-06 22:29:36	493ms
2	Ask For Approval	Completed	2026-09-06 22:29:37	1419ms
3	If If Approved	Evaluated - False	2026-09-06 22:29:38	55ms
4	Update Record	Not Run		
5	Send Email	Not Run		
6	Else	Completed	2026-09-06 22:29:38	2382ms
7	Update Record	Completed	2026-09-06 22:29:38	139ms
8	Send Email	Completed	2026-09-06 22:29:38	2243ms

5.8 Business Rule – Duplicate Request Validation

A Business Rule named **Laptop request BR** was created.

Configuration

Property	Value
Name	Laptop request BR
Table	Laptop Request Form
When	Before
Insert	Enabled
Advanced	Enabled

The Business Rule checks whether the employee has already submitted a laptop request during the current calendar year.

If a duplicate request is found, the system prevents the new request from being submitted and displays an error message.

This helps maintain data accuracy and prevents unnecessary duplicate requests.

The screenshot shows the ServiceNow interface for configuring a Business Rule. The browser address bar shows a URL from dev422291.service-now.com. The page title is 'Business Rule - Laptop request BR'. The configuration form includes the following fields:

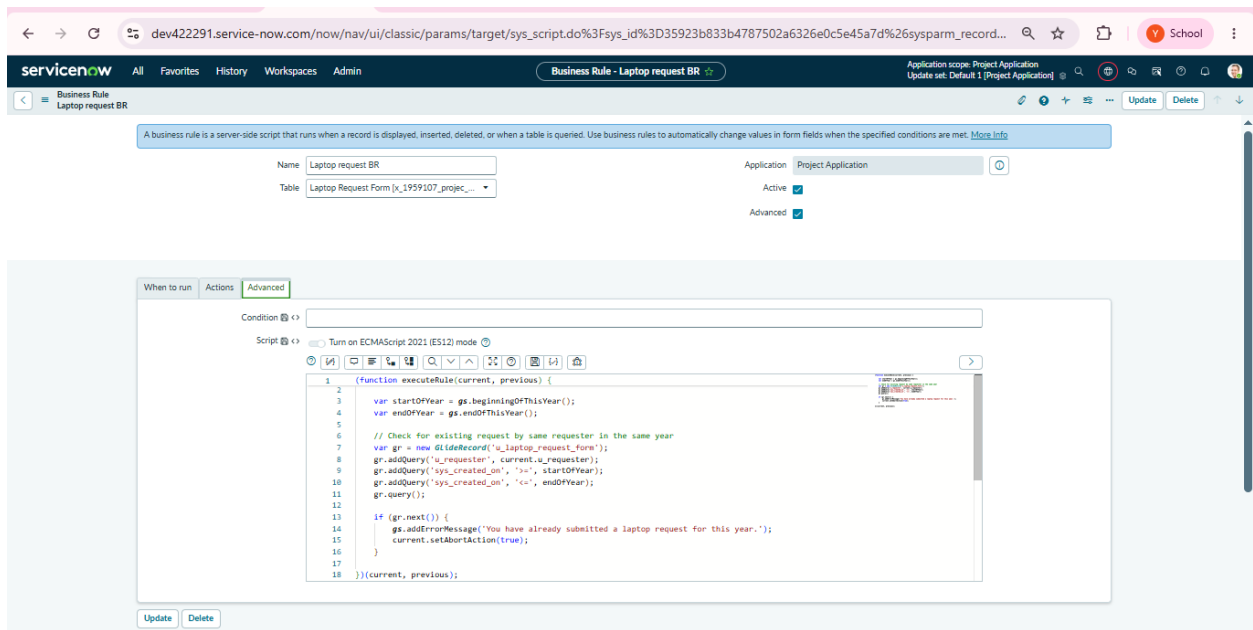

- Name:** Laptop request BR
- Table:** Laptop Request Form [x_1959107_project_...]
- Application:** Project Application
- Active:** ☒
- Advanced:** ☒

Below the main configuration, there are tabs for 'When to run', 'Actions', and 'Advanced'. The 'When to run' tab is selected, showing a description: 'Specify whether the business rule should run on Insert or Update. Use Filter Conditions to specify under which conditions the business rule should run.'

Under 'When to run', the 'When' dropdown is set to 'before' and the 'Order' is 100. To the right, there are checkboxes for 'Insert' (checked), 'Update' (unchecked), 'Delete' (unchecked), and 'Query' (unchecked).

The 'Filter Conditions' section has buttons for 'Add Filter Condition' and 'Add OR Clause'. Below these, there is a dropdown menu for 'choose field', an 'oper' dropdown, and a 'value' field. The 'Role conditions' section has a small icon.

At the bottom, there are 'Update' and 'Delete' buttons, a 'Related Links' section with a 'Run Point Scan' link, and a 'Versions' table with columns for 'Recorded at' and a search bar. The bottom right corner shows 'Actions on selected rows...' and a 'New' button.

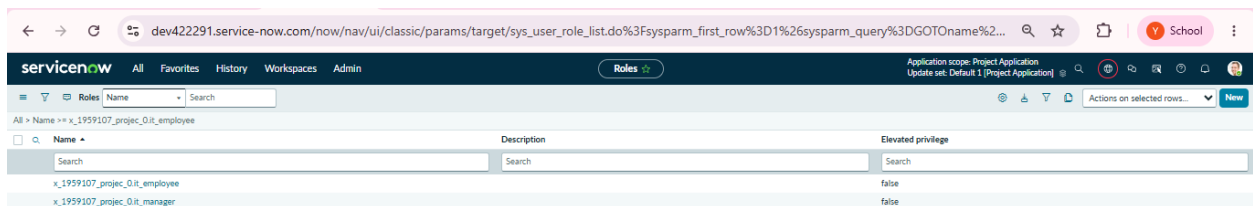

5.9 Roles and Groups Configuration

Roles and groups were created to implement role-based access.

Roles

Role	Purpose
it_employee	Create and manage laptop requests
it_manager	View requests and handle approvals

Groups

Group	Role
IT Employees	it_employee
IT Managers	it_manager

Users were added to the appropriate groups based on their responsibilities.

User Search

Group = IT Employee

User
Employee Ten
Employee Seven
Employee First
Employee Four
Employee Second
Employee Five
Employee Six
Employee Eight
Employee Nine

1 to 9 of 9

5.10 Access Control Lists (ACLs)

ACLs were configured to protect the Laptop Request Form table.

Employee Access

Employees are allowed to:

- Create requests

- Read requests
- Update their requests

Manager Access

Managers are allowed to:

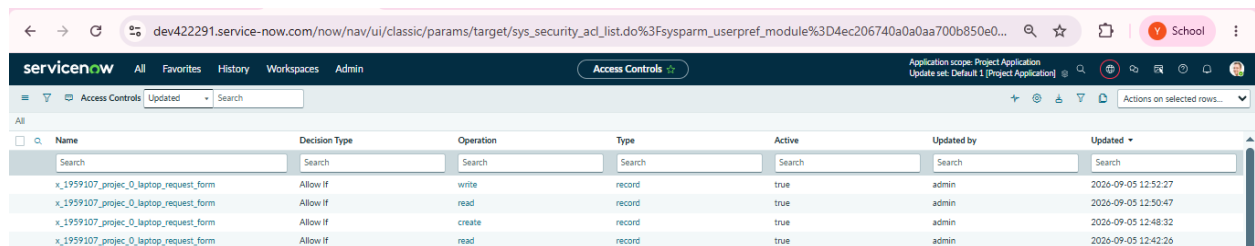

- View laptop requests
- Handle approval activities

Managers are not given permission to create or modify laptop request records unnecessarily.

Security Model

User → Group → Role → ACL → Laptop Request Table

This ensures that users can access only the operations allowed by their assigned roles.

The screenshot shows the ServiceNow interface for the 'Access Controls' table. The table lists security rules with columns for Name, Decision Type, Operation, Type, Active, Updated by, and Updated. The rules are for the 'x_1959107_project_0_laptop_request_form' and allow 'write', 'read', and 'create' operations.

Name	Decision Type	Operation	Type	Active	Updated by	Updated
x_1959107_project_0_laptop_request_form	Allow If	write	record	true	admin	2026-09-05 12:52:27
x_1959107_project_0_laptop_request_form	Allow If	read	record	true	admin	2026-09-05 12:50:47
x_1959107_project_0_laptop_request_form	Allow If	create	record	true	admin	2026-09-05 12:48:32
x_1959107_project_0_laptop_request_form	Allow If	read	record	true	admin	2026-09-05 12:42:26

5.11 Email Notifications

Email notifications were integrated with the approval workflow.

When a request requires approval, the manager receives an approval notification.

The notification contains information such as:

- Request number
- Requester
- Request type
- Reason
- Approval action

After the manager makes a decision, the requester receives a notification about the result.

Approval

Manager approves → Request status becomes Approved → Requester receives email

Rejection

Manager rejects → Request status becomes Rejected → Requester receives email

5.12 Final Application Configuration

The final application contains the following components:

Component	Status
Custom Application	Completed
Laptop Request Form	Completed
Table Fields	Completed
Approval Relationship	Completed
Record Producer	Completed
Employee Service	Completed
Catalog	Completed
Flow Designer	Completed
Business Rule	Completed
Roles	Completed
Groups	Completed
ACLs	Completed
Email Notifications	Completed
Testing	Completed
Update Set	Completed

6. TESTING AND OUTPUT

6.1 Test Environment

Testing was performed in the ServiceNow Personal Developer Instance.

The following components were tested:

- Laptop Request form
- Record Producer
- Business Rule
- Flow Designer
- Manager approval
- Email notifications
- Roles and ACLs
- Request status
- Duplicate validation

6.2 Test Scenarios

Test Case	Expected Result	Status
Employee submits request	Request is created	Pass
Select Basic request	Basic is recorded	Pass
Select Advance request	Advance is recorded	Pass
Submit duplicate request	Request is blocked	Pass
New request created	Status becomes Pending Approval	Pass
Manager receives approval	Approval notification received	Pass
Manager approves	Status becomes Approved	Pass
Manager rejects	Status becomes Rejected	Pass
Requester receives email	Notification received	Pass
Employee views request	Access allowed	Pass
Manager views request	Access allowed	Pass
Manager tries to create/modify	Access restricted	Pass
Employee creates/updates	Access allowed	Pass

6.3 User Acceptance Testing

User Acceptance Testing was performed to verify that the application meets the expected business requirements.

The main user scenarios tested were:

- Employee request submission
- Request type selection
- Request reason selection
- Duplicate request prevention
- Manager approval/rejection
- Status tracking
- Email notification
- Role-based access

All major scenarios produced the expected results.

6.4 Performance Testing

Performance testing was performed to verify that the system works smoothly during normal operations.

The following areas were checked:

- Request submission
- Duplicate validation
- Flow execution
- Approval processing
- Email notification
- Record retrieval
- Role and ACL validation

The application performed consistently for the expected project operations.

6.5 Security and Validation Testing

Security testing was performed to verify role-based access.

User	Operation	Expected
IT Employee	Create request	Allowed

IT Employee	View request	Allowed
IT Employee	Update request	Allowed
IT Employee	Duplicate request	Blocked
IT Manager	View request	Allowed
IT Manager	Approval	Allowed
IT Manager	Create request	Restricted
IT Manager	Modify request	Restricted

The configured roles, groups, ACLs, and Business Rule provide the required security and validation.

7. DEPLOYMENT AND UPDATE SET

7.1 Update Set Configuration

All major application configurations were captured in the update set:

HR Onboarding Application

The update set contains:

- Custom Application
- Laptop Request Form table
- Fields
- Record Producer
- Business Rule
- Flow Designer
- Email Notifications
- Roles
- ACLs
- Other required configurations

7.2 Update Set Preview

Before deployment, the update set was previewed in the target instance.

The preview was used to identify possible conflicts or missing dependencies.

7.3 Conflict Resolution

Any conflicts identified during the preview process were reviewed and resolved before committing the update set.

This ensured that the application could be transferred correctly to the target instance.

7.4 Update Set Commit and Deployment

After successful preview and conflict resolution, the update set was changed to **Complete** and committed to the target instance.

The update set was also exported as an XML file for transferring the application configuration between ServiceNow instances.

8. COMPLETE PROJECT WORKFLOW

8.1 End-to-End Request Journey

The complete request process is:

Employee

↓

Employee Service Catalog

↓

Laptop Request Record Producer

↓

Laptop Request Form Table

↓

Business Rule

↓

Duplicate Validation

↓

Flow Designer

Status = Pending Approval

Manager Approval

Approved

Rejected

Status = Approved

Status = Rejected

Email to Requester

Email to Requester

8.2 Data Flow Diagram

Data Flow

Employee

→ Submits laptop request

→ **Record Producer**

→ Creates record

→ **Laptop Request Form**

→ **Business Rule**

→ Checks duplicate request

→ **Flow Designer**

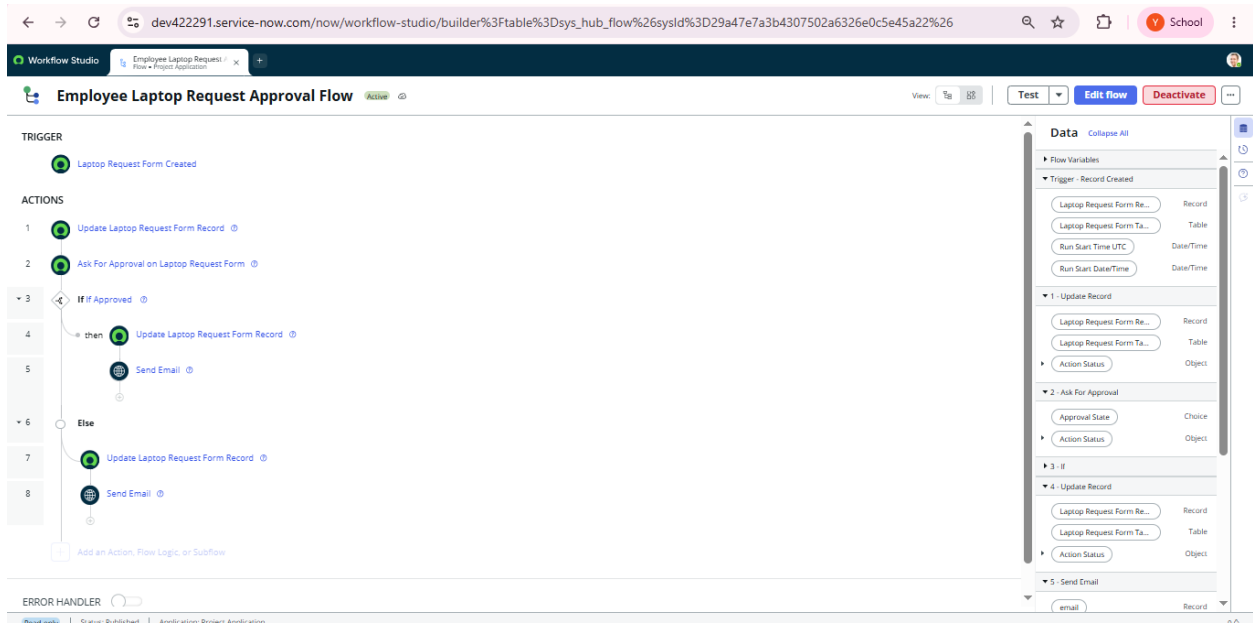

→ Sends approval to **Manager**

→ Manager approves/rejects

→ Updates **Status**

→ Sends **Email Notification**

→ **Employee**

8.3 System Architecture

The system architecture consists of the following components:

Service Portal / Employee Center

Record Producer

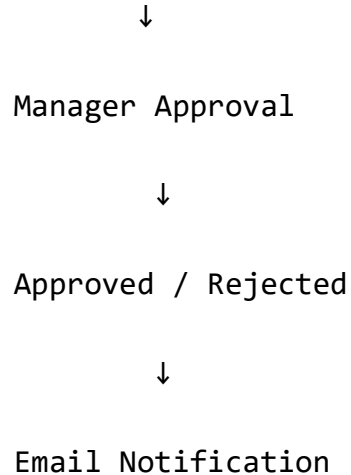

Laptop Request Form

Business Rule

Flow Designer

Security is implemented through:

Users → Groups → Roles → ACLs → Application Data

9. CONCLUSION

The **Employee Laptop Request Management System** was successfully developed using ServiceNow.

The application provides a centralized and automated process for submitting, validating, approving, and tracking employee laptop requests.

The system successfully implements:

- Employee laptop request submission
- Basic and Advance request classification
- Duplicate request prevention
- Automated manager approval
- Request status tracking
- Email notifications
- Role-based security
- ACL-based access control
- Request approval tracking
- Update Set based deployment

The system reduces manual communication, improves request visibility, prevents duplicate requests, and provides a structured approval process.

Overall, the project demonstrates how ServiceNow can be used to build a **secure, automated, and user-friendly employee request management application**.
