

Problem Statement

1. Problem Identification

The current laptop request process is mainly handled through **emails and verbal communication**, which can cause delays, duplicate requests, and difficulty in tracking request status.

2. Key Problems

	Problem	Description
1	Manual Requests	Employees depend on emails or verbal requests to request laptops.
2	Duplicate Requests	The same employee may submit multiple requests within a year.
3	Approval Delays	Laptop requests may be delayed due to manual approval processes.
4	Poor Tracking	Employees and IT teams have limited visibility into request status.
5	Lack of Standardization	Request details and reasons may not be captured consistently.

3. Problem Statement

There is a need for a **centralized and automated laptop request management system** that allows employees to submit requests easily, prevents duplicate requests, automates approvals, and provides clear request status tracking.

4. Proposed Solution

The **Employee Laptop Request Management System** will be developed using **ServiceNow** to provide:

- Self-service laptop request submission
- Basic and Advance request classification

- Duplicate request prevention
- Automated approval workflow
- Request status tracking
- Email notifications
- Role-based access control

The solution will replace manual processes with a **standardized and controlled digital workflow**.
