

Solution Requirements

1. Functional Requirements

S. No.	Requirement	Description
1	Laptop Request Submission	Employees should be able to submit laptop requests through the Service Portal.
2	Request Details	The system should capture requester, email, request date, type, manager, and reason.
3	Request Classification	Employees should select Basic or Advance request type.
4	Duplicate Prevention	The system should prevent more than one laptop request from the same employee within a year.
5	Approval Workflow	The system should automatically send the request to the manager for approval.
6	Status Management	The request status should update as Pending Approval, Approved, or Rejected .
7	Email Notifications	The system should notify the manager and requester about approval results.
8	Request Tracking	Employees and IT teams should be able to track request status.
9	Role-Based Access	Employees and managers should have different access permissions.
10	Deployment	All configurations should be captured in an Update Set and deployed to another instance.

2. Security Requirements

Role	Access
IT Employee	Create, read, and update laptop requests
IT Manager	View laptop requests and approve/reject requests
System Administrator	Configure and manage the application

3. Business Rules

- Allow only **one laptop request per employee per year**.
- Block duplicate requests automatically.
- Display an error message when a duplicate request is submitted.
- Set new requests to **Pending Approval**.

4. Automation Requirements

- Automatically trigger the Flow when a laptop request is created.
- Send the request to the employee's manager.
- Wait for approval or rejection.
- Update the request status automatically.
- Send email notifications at appropriate stages.

5. Non-Functional Requirements

Requirement	Description
Security	Access should be controlled using roles, groups, and ACLs.
Usability	The request form should be simple and user-friendly.
Reliability	Business rules and workflow should work consistently.
Maintainability	Configurations should be organized within the custom application and update set.
Scalability	The solution should support multiple employees and managers.

6. Deployment Requirement

All application configurations, including the **custom application, table, Record Producer, Business Rules, ACLs, Flow Designer workflow, and email notifications**, should be captured in the **HR Onboarding Application Update Set** and moved to the target instance using Update Set deployment.
