

PROJECT PLANNING

1. Project Overview

The **Employee Laptop Request Management System** is a ServiceNow-based application designed to simplify and automate the process of requesting laptops by employees. The system provides a centralized platform where employees can submit laptop requests through a user-friendly form. The submitted requests are stored in a custom application table and processed through an automated approval workflow.

The application integrates **Record Producer, Service Portal/Employee Center, Flow Designer, Business Rules, ACLs, and Email Notifications** to provide a structured and secure request management process.

2. Problem Identification

In a traditional laptop allocation process, employees may need to communicate with managers, HR teams, or IT support through emails or manual requests. This can result in delays, difficulty tracking requests, lack of visibility, and manual effort in managing approvals.

To overcome these issues, the proposed system provides a centralized ServiceNow application where employees can submit laptop requests and track the request process through an automated workflow.

3. Project Objectives

The main objectives of the project are:

- To provide a centralized platform for employees to submit laptop requests.
- To create a user-friendly **Laptop Request Form** using a Record Producer.
- To store submitted request information in a custom ServiceNow table.
- To automate the manager approval process using **Flow Designer**.
- To provide separate access based on user roles and permissions.
- To protect application data using **ACLs**.

- To automate request-related notifications through email.
- To reduce manual processing and improve request tracking.
- To provide a structured workflow from request submission to approval and fulfillment.

4. Proposed System

The proposed system uses the ServiceNow platform to manage the complete laptop request lifecycle.

The employee accesses the **Employee Center/Service Portal** and selects the Laptop Request option. The employee enters the required information and submits the request. The Record Producer creates a corresponding record in the custom Laptop Request Form table.

After submission, **Flow Designer** automatically starts the approval process and sends the request to the appropriate manager/approver. Based on the approval decision, the request proceeds either toward fulfillment or rejection. Automated email notifications are generated to inform the concerned users about important request status changes.

5. Major Modules

5.1 Employee Request Module

This module allows employees to submit laptop requests by entering the required details through the Laptop Request Form.

5.2 Record Producer Module

The Record Producer provides the interface for collecting employee laptop request information and automatically creates a record in the custom application table.

5.3 Request Management Module

This module stores and manages all submitted laptop requests in the custom **Laptop Request Form** table.

5.4 Approval Module

The approval process is automated using **Flow Designer**. Submitted requests are routed to the appropriate manager/approver for review.

5.5 Notification Module

Email notifications are used to communicate important events such as request submission, approval, rejection, and other status changes.

5.6 Security Module

Application security is implemented using **Access Control Lists (ACLs)** and appropriate user roles to ensure that users can access only the information and operations permitted to them.

5.7 Business Rules Module

Business Rules are used to implement server-side logic and automate specific actions when records are created or updated.

6. Technology and Platform

The project is developed using the following technologies and ServiceNow components:

- **Platform:** ServiceNow
- **Application Development:** ServiceNow Studio
- **User Interface:** Employee Center / Service Portal
- **Form Creation:** Record Producer
- **Workflow Automation:** Flow Designer
- **Database:** ServiceNow Tables
- **Server-side Logic:** Business Rules
- **Security:** ACLs and User Roles
- **Communication:** Email Notifications
- **Deployment:** Update Sets

7. Project Implementation Plan

The project is planned and implemented in the following phases:

Phase 1 – Requirement Analysis

Identify the requirements of employees, managers, and administrators for the laptop request process.

Phase 2 – Application Design

Design the application structure, custom table, fields, user roles, request form, and overall workflow.

Phase 3 – Application Development

Create the custom ServiceNow application and configure the Laptop Request Form table and required fields.

Phase 4 – Record Producer Development

Create a Record Producer that allows employees to submit laptop requests through the Employee Center/Service Portal.

Phase 5 – Workflow Automation

Develop the Flow Designer workflow to automatically process submitted requests and obtain manager approval.

Phase 6 – Security Implementation

Configure user roles and ACLs to control access to application data and operations.

Phase 7 – Notification Configuration

Configure email notifications for request submission, approval, rejection, and relevant status updates.

Phase 8 – Testing

Test the complete request lifecycle, including form submission, record creation, approval, rejection, notifications, security, and workflow execution.

Phase 9 – Deployment

Package the application components using an Update Set and deploy the completed configuration to the required ServiceNow instance.

8. Expected Outcome

The completed system is expected to provide a centralized and automated solution for employee laptop requests. Employees will be able to submit requests easily, managers will be able to review and approve requests efficiently, and administrators will have better visibility into the complete request lifecycle.

The system will reduce manual communication, improve transparency, provide controlled access to information, and make the laptop request and approval process more efficient.

9. Project Success Criteria

The project will be considered successful when:

- Employees can successfully submit laptop requests.
- Submitted requests create records in the custom table.
- The approval workflow is triggered automatically.
- Managers can approve or reject requests.
- Request status is updated correctly.
- Email notifications are generated at appropriate stages.
- Unauthorized users cannot access restricted information.
- The complete workflow works without manual intervention.
- The application can be transferred between ServiceNow instances using Update Sets.
